Computer Networks - laboratory exercise:

UNIX/Linux operating system basics

Basic commands cheat sheet

symbol or	meaning	
command	using the towning!	
using the terminal		
man	manual pages for a command, e.g.:	
	man pwd – display help for command pwd	
clear	clear the terminal screen	
Ctrl+L	clear the terminal screen	
[tab key]	auto-completion of the name that you started to enter	
	wildcard matching zero or more characters (most commands allow using	
_	wildcards in their arguments), e.g.:	
*	• file* – all of these are a match: file, file.txt, file1, file_ABC.jpg, and so on	
	• m*e – all of these are a match: me, mae, mbe, mce, mAe, m5e, mike, mouse,	
	my_program.exe, and so on	
	wildcard matching exactly one character (most commands allow using wildcards	
?	in their arguments), e.g.:	
	• file? – all of these are a match: file1, file2, filea, fileA, and so on	
	• m?e – all of these are a match: mae, mbe, mAe, m1e, m5e, m.e, and so on	
	directories	
•	current directory (working directory)	
• •	parent directory of the current directory	
/	root directory in the system; also, separator in paths	
~	home directory of the current user (usually in the form /home/name_of_user)	
pwd	p rint w orking d irectory (display the path to the current directory)	
cd	c hange d irectory (change working directory to some other one), e.g.:	
	• cd ~ - go to your home directory	
	• cd – go to the parent directory of the current directory	
	• cd dir – go to directory dir	
ls	list the contents of a directory, e.g.:	
	• 1s – display the content (files and subfolders) of the current directory	
	• ls dir – display the content of directory dir	
ls -l	list directory contents using a long listing format (it shows, e.g. file permissions,	
	owner, size in bytes, modification date)	
mkdir	make (create) a directory, e.g.:	
	• mkdir my_directory	
rmdir	remove an empty directory, e.g.:	
	• rmdir my directory	

	files
touch	create an empty file (or change modification date of existing file), e.g.:
	• touch file1.txt-create a file with .txt extension
	• touch my_file - create a file with no extension
ср	copy a file, e.g.:
	• cp file1 file2 - copy file1 to a file called file2 (both in current
	directory)
	• cp dir1/file dir2/copied_file - copy a file from directory dir1
	to directory dir2 and give a new name to the copied file
	• cp dir1/file dir2 - copy a file from directory dir1 to directory dir2
	and keep the same name of the file
cp -r	copy files recursively (including directories), e.g.
	• cp -r dir1 dir2 - copy directory dir1 with all its files and subfolders to
	directory dir2
m∨	move a file to different location or rename it, e.g.:
	• mv file1 shopping_list.txt - rename file1 to shopping_list.txt
	• mv file1 dir1 - move file1 from current directory to directory dir1 and
	keep the name of the file unchanged
	 mv file1 dir1/new_file - move file1 from current directory to directory dir1 and change the name of the file at the same time
rm	remove a file, e.g.:
± 111	• rm file1
rm -r	remove files recursively (remove nonempty directories), e.g.:
	• rm -r my_dir_with_stuff_inside
chown	change file owner and/or group
chgrp	ch ange gr ou p ownership of a file
chmod	ch ange file mod e bits (change file permissions) – more on permissions under
	the link "Linux: rwx permissions" provided on the course webpage; e.g.:
	• chmod 777 file — everyone may read, write or execute the file (please
	first consider if this is a safe setting)
	• chmod 700 file – the owner may read, write or execute the file; other
	user cannot do any of these operations
find	search for files matching the given criteria in a directory tree – more details
	under the link "Linux: 'find' command" provided on the course webpage; e.g.:
	• find dir – like a recursive version of ls: search for all files and
	subdirectories (and their files and subdirectories, and so on) inside directory dir
	• find dir -name "test.txt" - search for all files called test.txt in all subdirectories of dir
	 find dir -name "test*" - search for all files whose names begin
	with "test" in all subdirectories of dir (so, all of these match: <i>test</i> , <i>test</i> 1,
	test24.txt, testing my program.cpp and so on)
	• find dir -iname "*.txt" - search for all files with .txt extension in
	all subdirectories of dir, but ignore the case (so, all of these match: .txt, .TXT,
	.TxT, .txT and so on)

links and aliases		
In	make hard links between files – more about hard links under the link "Linux:	
	hard and soft links" provided on the course webpage; e.g.:	
	• ln file1 my_link - creates a hard link called my_link which points to	
	file file1	
ln -s	make s ymbolic (soft) lin ks between files – more about soft links under the link	
	"Linux: hard and soft links" provided on the course webpage; e.g.:	
	• ln -s file1 my_link - creates a symbolic link called my_link which	
	points to file file1	
alias	create an alias (alternative name) for a command, e.g.:	
	• alias cdd='cd ~/Desktop' - after that, you can execute a new	
	"command" cdd instead of cd ~/Desktop to go to the desktop of the	
	current user	
	• alias — display all existing aliases	
	alias cdd – display the command that has alias cdd	
unalias	remove an alias of a command, e.g.	
	• unalias cdd – after that, cdd will no longer work	
	text printing (displaying) and filtering	
echo	print a text, e.g.:	
	echo something – print the text <i>something</i> on the screen	
	• echo -e "Text with\tbackslash escape codes\ninterpretation" – print the text	
	Text with[tab character]backslash escape codes[newline]interpretation	
	echo \$var – print the value of variable var on the screen	
cat	con cat enate files and print them on the screen, e.g.:	
	• cat file1 – print the content of file1	
more	• cat file1 file6 – print the content of file1, then of file6	
more	print a file on the screen, one screenful at a time (press enter to show next line, press space bar to show next page; no scrolling up), e.g.:	
	• more long text.txt	
less	print a file on the screen with up-down scrolling (use arrow keys for it) and	
1633	searching options (type /pattern to search for pattern), e.g.:	
	• less long text.txt	
head	print only a few first lines of a file, e.g.:	
nead	 head long text.txt - print the first 10 lines of the file (10 is the 	
	default)	
	 head -n 3 long text.txt-print the first 3 lines of the file 	
tail	print only a few last lines of a file, e.g.:	
	• tail long text.txt - print the last 10 lines of the file (10 is the	
	default)	
	• tail -n 3 long text.txt - print the last 3 lines of the file	
sort	alphabetically sort the lines of a text file, e.g.:	
	 sort favourite movies.txt-print the lines of the file 	
	favourite_movies.txt in alphabetical order	
•	· · · · · · · · · · · · · · · · · · ·	

Interest		,			
grep cookie file1 – print all the lines from file1 that contain the word cookie grep –i cookie file1 – print all the lines from file1 that contain the word cookie and ignore the case (so, all of these match: cookie, COOKIE, Cookie and so on) cut print selected parts of lines of a file strings print strings of printable characters in a file (especially useful on binary files) wc print line, word and byte count for a file determine file type // O redirection more on input/output redirection under the link 'Linux: I/O redirection' provided on the course webpage redirect standard output of a command/program to a file (instead of to the screen) with overwriting the file contents, e.g.: echo My text > file.txt – execute command echo and print its output to file.tx instead of displaying it on the screen; remove the previous content of the file if it existed redirect standard output of a command/program to a file (instead of to the screen) with appending to the file, e.g.: echo My text >> file.txt – execute command echo and print its output to file.txt instead of displaying it on the screen; add the new content at the end of the file (do not remove existing content if it existed) redirect standard input of a command/program from a file (instead of from the keyboard), e.g.: my_program xyz 1 2 - run my_program with command line arguments given from the keyboard, whereas: my program / my program / file - run my_program with command line arguments read from a file pipe - redirect standard output of a command to standard input of another command, e.g.: cat file1 file2 sort head -n 3 - read the two files, then sort their lines alphabetically, then display the first 3 of the sorted lines // disk usage (size) of directories and files // processes ps report process status (a snapshot) top display information about processes (with real-time update)	grep				
word cookie and ignore the case (so, all of these match: cookie, COOKIE, Cookie and so on) cut print selected parts of lines of a file strings print strings of printable characters in a file (especially useful on binary files) wc print line, word and byte count for a file file determine file type //O redirection more on input/output redirection under the link 'Linux: I/O redirection' provided on the course webpage redirect standard output of a command/program to a file (instead of to the screen) with overwriting the file contents, e.g.: echo My text > file.txt - execute command echo and print its output to file.txt instead of displaying it on the screen; remove the previous content of the file if it existed redirect standard output of a command/program to a file (instead of to the screen) with appending to the file, e.g.: echo My text >> file.txt - execute command echo and print its output to file.txt instead of displaying it on the screen; add the new content at the end of the file (do not remove existing content if it existed) redirect standard input of a command/program from a file (instead of from the keyboard), e.g.: my program xyz 1 2 - run my_program with command line arguments given from the keyboard, whereas: my program < file - run my_program with command line arguments read from a file pipe - redirect standard output of a command to standard input of another command, e.g.: cat file1 file2 sort head -n 3 - read the two files, then sort their lines alphabetically, then display the first 3 of the sorted lines disk usage df (disk free) disk space usage (free and used) for mounted file systems disk usage (size) of directories and files processes ps report process status (a snapshot) top display information about processes (with real-time update)		• grep cookie file1 - print all the lines from file1 that contain the			
word cookie and ignore the case (so, all of these match: cookie, COOKIE, Cookie and so on) cut print selected parts of lines of a file strings print strings of printable characters in a file (especially useful on binary files) wc print line, word and byte count for a file file determine file type //O redirection more on input/output redirection under the link 'Linux: I/O redirection' provided on the course webpage redirect standard output of a command/program to a file (instead of to the screen) with overwriting the file contents, e.g.: echo My text > file.txt - execute command echo and print its output to file.txt instead of displaying it on the screen; remove the previous content of the file if it existed redirect standard output of a command/program to a file (instead of to the screen) with appending to the file, e.g.: echo My text >> file.txt - execute command echo and print its output to file.txt instead of displaying it on the screen; add the new content at the end of the file (do not remove existing content if it existed) redirect standard input of a command/program from a file (instead of from the keyboard), e.g.: my program xyz 1 2 - run my_program with command line arguments given from the keyboard, whereas: my program < file - run my_program with command line arguments read from a file pipe - redirect standard output of a command to standard input of another command, e.g.: cat file1 file2 sort head -n 3 - read the two files, then sort their lines alphabetically, then display the first 3 of the sorted lines disk usage df (disk free) disk space usage (free and used) for mounted file systems disk usage (size) of directories and files processes ps report process status (a snapshot) top display information about processes (with real-time update)		• grep -i cookie file1 - print all the lines from file1 that contain the
